

7/3/2026

Course Code: DCIT208

Assignment Number: IA2

Assignment Title: Client Interview Evidence and Requirement Transformation Memo

Full Name: Benedict Frimpong

Student ID: 22390234

Team Name: SolutionLabs

Project Title: Online Shoe Shop

Team Repository URL: <https://github.com/Dept-of-Comp-Sci-University-of-Ghana/dcit208-client-project-2026-team-engineering-repository-seg26-64-solutionl>

Individual Portfolio Repository URL: <https://github.com/heismila/Individual-portfolio-22390234>

July 3, 2026	ChatGPT	Help with assignment structure and formatting	Used templates and format guidance	Rejected generic examples	Verified against my client interview notes

SECTION 1: PERSONAL QUESTION SET

1. Can you walk me through how you currently sell shoes to customers from start to finish?
2. What tools or methods are you currently using to manage your shoe inventory, track sales and keep customer records?
3. What is the most frustrating or difficult part of running your shoe business right now?
4. Is there a task related to managing your shoe shop that takes too much of your time or causes you stress?
5. What information about each shoe is most important for customers to see when they visit your shop?
6. What customer information do you need to collect and keep track of when someone makes a purchase?
7. If this online shoe shop were a huge success, what would it allow you to do that you can't do right now?
8. How would you measure the success of the online shoe shop? What numbers or results would make you happy?
9. What are your concerns about customers payment information, personal data, or the overall security of the online shop?
10. What should happen if a customer orders a shoe size that is out of stock, or if the customer wants to return a pair of shoes?
11. Do you have any competitors that sell shoes online? What do they do well that you will like to do more than that

SECTION B: INTERVIEW/OBSERVATION EVIDENCE

Date: July 3, 2026

Time: 2:00 pm

Medium: WhatsApp Voice Call

Participant Role: Owner of Brvhnuel Shoe Store

Evidence Type: Detailed Interview Notes

Summary

I conducted a 20-minute interview with Mr. Emmanuel Obeng Osei, the owner of Brvhnuel Shoe Store, via WhatsApp voice call. He currently sells shoes through a physical shop and also takes orders via WhatsApp. When a customer messages him asking about shoe, he sends photos of available shoes and checks her physical stock notebook to confirm if sizes are available. If the customer want to buy, he records the order in his notebook and arranges for delivery or pickup.

His main frustrations are: (1) he often forgets to update her stock notebook when shoes are sold, leading to situations where she tells a customer a shoe is available but it's actually sold out, and (2) customers frequently ask them same questions about sizes and availability, which takes up a lot of her time answering individually.

Regarding date, she said customers need to see: shoe brand, size, color, price, material and availability. He also collect customer names and phone numbers for orders but would like to collect email addresses for marketing. He mentioned he has tried to keep customer records but the notebook system makes it difficult to find past customers.

Success for her means: (1) selling more shoes without having to spend extra time answering repetitive questions, (2) having an automated system that updates stock immediately after each sale, and (3) having a way to easily see which shoes are selling well.

His main security concern is that customers might not trust paying online. He wants to use a trusted payment gateway like paystack or Momo to ensure safe payments. He also worries about customers data being stolen or shared without permission.

For failure handling, he said if a shoe is out of stock, the system should immediately shoe it as unavailable so customers can request returns and the system tracks them automatically.

SECTION C: REQUIREMENT TRANSFORMATION

Raw Client Statement:

I always forget to update my stock when I sell a shoe, so I end up telling customers the shoe is available when it's actually sold out.

Functional Requirement:

The system shall automatically reduce the stock quantity by 1 every time a customer successfully completes a purchase.

Non- Functional Requirement:

The stock quantity shall update within 2 seconds of a purchase being confirmed.

User Story:

As a busy shop owner, I want stock to update automatically after each sale so that I never accidentally sell shoes I don't have.

Acceptance Criteria:

1. Given there are 10 pairs of size 42 Nike shoes in stock, when a customer buys 1 pair, then the stock display 9.
2. Given there is 1 pair of size 38 Adidas shoes in stock, when a customer buys it, then the system shows out of stock for that size.
3. Given a customer adds a shoe to their cart, when they do not complete the purchase, then the stock quantity remains unchanged.

API/Interface Implication:

The system will need to integrate with a payment gateway API (e.g., paystack) to confirm successful payment and trigger stock updates.

Data Implication:

The system must store and manage: shoe brand

Test Idea:

To create a test where a customer buys 3 pairs of shoes from a stock of 15. Verify that after the purchase, the stock displays exactly 12. Then verify that the customer's order history shows the correct order details.

Open question:

What should happen if a customer places an order but the payment takes longer than expected to process? Should the stock decrease immediately or only after payment confirmation?

SECTION D: REFLECTION

Before I interviewed the shoe shop owner, I assumed that the most important thing for an online shoe shop was having an attractive, modern design with beautiful product images. I thought the client would care most about colors, fonts and making the website look elegant to attract customers and compete with other online shoe stores.

However, after speaking with the client, my understanding changed significantly. The client emphasized that what they really needed was a simple way to manage shoe details and control which shoes appear on the website. I realized the client's main concern was not the visual appearance of the website, but rather having control over their inventory and what customers can see online.

The specific conversation that changed my point of view was when the client mentioned that they need a better way to manage shoe details. This made me realize that the client values accuracy and control over visual appeal. A beautiful website is useless if the client cannot easily manage the information about their shoes. Without proper management, customers might see incorrect prices, sizes or availability, which would damage the client's reputation and lose sales.

Another important insight was that the client wants to decide which shoes appear on the website. I initially assumed that all shoes would be shown to customers. However, the client wants the ability to choose which shoes are visible. This could be because some shoes are out of stock or only available in limited quantities. This taught me that clients need flexibility and control over their online presence.

Overall, this experience taught me that assumption can be dangerous in software development. Before building a system, I must take time to understand what the client actually needs, not what I think they need. The most important skill is listening and asking the right question to uncover the real problems. A successful system is not the one with the most features, but the one that solves the client's actual problems.
